# Restore confidence in one appointment

## Opalustre®

Opalustre is a 6.6% hydrochloric acid slurry that contains silicon carbide microparticles. This helps remove unsightly enamel decalcification defects that are less than 0.2 mm in depth. Ideal for superficial white and brown demineralization due to enamel mottling from fluorosis.<sup>1</sup>

- **Removes superficial white and brown stains**
- **Provides minimally invasive treatment for fluorosis**
- **Comes in a direct, mess-free delivery**
- **One-appointment results**

## Chemical & Mechanical Abrasion Slurry

- 554 Opalustre Kit**

 20 x OpalCups bristle

- 5799 OpalCups™ Finishing**  
 20 x OpalCups finishing

Before.

After rubber dam placement, apply Opalustre to discolored enamel.

Bristle cup compresses Opalustre on tooth surface. Intermittent rinsing and observation is recommended.

After enamel microabrasion and 21 days of whitening with Opalescence<sup>®</sup> PF.
